Advertisements of ME Subnets to rest of network?

Questions?

Thoughts?

• How to handle the migration? What networks will need to be connected directly between the two locations?

• Will the USON traffic be allowed out the CORE to access the Internet? (this is how it is today) How will prevent accessing other internal McK resources?

• Is connection needed to NDH directly? How will other USON resources communicate with each other?

• How much traffic is between DDC USON and DDC McK? Should leave a FW local to handle?

• How to connect DDA11 USONME to DDC USON until all resources are vacated?

• Will need advertise the DDA11 USONME IP space out McK backbone. How? How to deal with same advertisements from NDH USONME?

• How to "stretch" VLAN13 IP space? When to move GW? What are other dependencies?

• Are there other public spaces that will need to be "stretched" for this effort? What about other activities?

• What about IntraFusion? Are they required to be part of USONME? THhey have other hub sites that are not currently part of that separation.

• Is there a way to stand up new FW in parallel with old FW without changing IP addresses?

• Leave one FW in DDC to allow for DDC USON to McK & Internet traffic and L2 connect to DDA11 FW for USONME traffic. (Would need to create additional routed interface between old FW and both new FW)

• L2 connect DDC1-USON-DSW to DDA11 FWs like exists today in USON vrf. (Downside would add ~80ms rtt to traffic from DDC USON to DDC McK and >40ms rtt for all other traffic except DDA11) (Would need to advertise DDC USON routes)

• L2 connect DDA11 and DDC USONME VLANs for migration efforts. Might be needed for other uses.

• L2 connect "VLAN 13" space between DDA11 and DDC

• Migration order possibility: (will depend upon how to connect to legacy networks)

• Create the L2 extension of the USONME-ASW network as needed

• Build new FWs and get routing working for non-ME interfaces

• Build all new components and validate as best possible

• Migrate FW to Core peering

• Migrate ERTs and FW5/6

• Migrate VRTs and USONME-FW

• L2 connect "VLAN13"

• Migrate USONVPN-FW

• Migrate GRTs and move IP space advertisements to DDA11
